

Reduce your expenditure on oil by up to 90%

Research shows that 70% of contaminants (by weight) in oil are between 0.1 & 1µm.

The primary source of contamination of oil is due to oxidization of the particles in the oil. If you remove the small particles and the water then you will virtually eliminate oxidation.

Europafilter's EF series "Oil Cleaning System" will remove:

- Solid particles down to < 0.1micron
- 98.3% of all free, encapsulated & emulsified water
- 99% of varnish
- Bacteria

The EF series "Oil Cleaning System" can allow clients to re-use their oil for many years potentially reducing oil consumption by up to 90% and reducing machine downtime significantly.

- A large blow moulding manufacturer has used the same oil for 17 years
- A large oil & gas producer used the same oil in 5 gas compressors for 10 years

The EF system can be applied to almost any known oil application
